CUI Reader

- Developments -

Date de mise en ligne : Sunday 1 March 2009

bhbn.free.fr

The [CREATE USB Interface](#) (or CUI board) is made and produced by Dan Overholt (AAU, DK). It is IMO a good alternative to the more famous and more industrial [Arduino](#), and I had the opportunity to play a bit with it.

Anyway, the point is the following:

CUI boards are provided as HID usb devices, so, reading data from them means reading a HID device.

The little source provided here just does that for **Linux**! :

CUIReader

Warning; *this is not a specific driver for the CUI board, this is not a ready made application, and this is provided without guarantee of any kind :). But if you are a decent C programmer, this should just help get you started!*
